The 4D Composite Higgs boson at the LHC and a LC

Stefano Moretti (NExT Institute, Southampton & RAL)
With D. Barducci, A. Belyaev, M.S. Brown, S. De Curtis and G.M. Pruna

Based on arXiv:1302.2371, arXiv:1306.6876 & arXiv:1304.4639

B'ham, 29 Feb 2014

Outline

Preamble:

- A Higgs(-like) signal has been observed at the LHC (supplemental earlier evidence from Tevatron as well)
- Both ATLAS and CMS confirm it, very SM-like
- Mass measurements around 125 GeV
- Candidate data samples: $\gamma\gamma$, ZZ^*, WW^*, $b\bar{b}$ and $\tau^+\tau^-$ (in order of decreasing accuracy and/or significance) plus invisible

Motivation:

- Some inconsistency with the SM predictions existed (still exists), particularly in the (most significant) $\gamma\gamma$ channel
- Either way, it is mandatory to explore BSM solutions
- Whereas the 'fundamental Higgs' hypothesis is being quantitatively tested in several models, the 'composite Higgs' one has only been marginally studied in comparison
- All (pseudo)scalar objects discovered in Nature have always been fermion composites

Outline

Desclaimer:

- This talk is about a phenomenological analysis aimed at capturing the essentials of CHMs, it is not about building them and/or comparing their pros and cons
- It thus adopts a specific CHM realisation that it is entirely calculable, the 4DCHM, apart from its UV structure
- For an analysis of the Higgs data, knowledge of the latter is not strictly necessary

Content:

- The 4DCHM (touch and go)
- Implementation (trust me, it is damn complicated but it is correct)
- Results (not exciting as one might have hoped, yet not so frustrating as in many other BSM scenarios)

4DCHM

Even with discovery of a Higgs particle, SM may not the end of the story (hierarchy and naturalness problems)

Two possible scenarios

Weak coupling

- Supersymmetry

Strong coupling

- Technicolor
- Extra dimensions
- Composite Higgs

A possible Composite Higgs scenario

- Higgs doublet arise from a strong dynamics
- Higgs as a (Pseudo) Nambu-Goldstone Boson (PNGB)

Idea from the '80s: spontaneous breaking of a symmetry $G \to H$

Georgi and Kaplan, Phys.Lett. B136, 183 (1984)

4DCHM

Simplest example was considered by Agashe, Contino and Pomarol (arXiv:0412089)

- Symmetry pattern $SO(5) \to SO(4)$

The coset $SO(5)/SO(4)$ turn out to be one of the most economical:

4 Pseudo Nambu-Goldstone Bosons (PNGBs)
(minimum number to be identified with the SM Higgs doublet)

Potential generated by radiative corrections $\to$ light Higgs

(a la Coleman, Weinberg '73)

Extra-particle content is present

- Spin 1 resonances
- Spin 1/2 resonances

4DCHM

4DCHM of De Curtis, Redi, Tesi (arXiv:1110.1613): highly deconstructed 4D version of general 5D theory

- Just two sites: Elementary and Composite sectors
- Mechanism of partial compositness (e.g. mixing between elementary and composite states - 3^{rd} generation quarks, cfr $\gamma - \rho$ mixing in QCD)

Effective 4D model, hence needs UV completion, (largely) irrelevant for Higgs sector

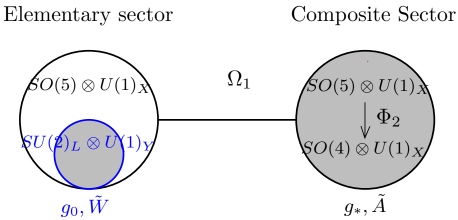
Minimal: single $SO(5)$ multiplet of resonances from composite sector (only dof's accessible at the LHC)

The 4DCHM represents the framework to study CHMs in a complete and computable way

Generic features of all relevant CHMs are captured

4DCHM

Bosonic sector



De Curtis, Redi, Tesi '11

$\Omega_1 = exp(\frac{i\Pi}{2f})$ Π Goldstone Matrix

f scale of the symmetry breaking (compositeness scale)

$\Phi_2 = \Omega_1 \phi_0 \quad \phi_0 = (0, 0, 0, 0, 1) = \delta^{i5}$

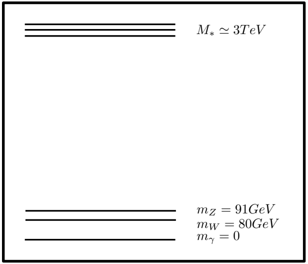
11 new gauge resonances

5 Neutral 6 Charged (c.c.)

4DCHM

Bosonic sector mass spectrum

Bosonic sector mass spectrum



Gauge boson mass $\geq$ 1.5 TeV from EWPTs

$$M_Z^2 \simeq \frac{f^2}{4} g_*^2 (s_\theta^2 + \frac{s_\psi^2}{2})\xi$$
$$M_{Z_1}^2 = f^2 g_*^2$$

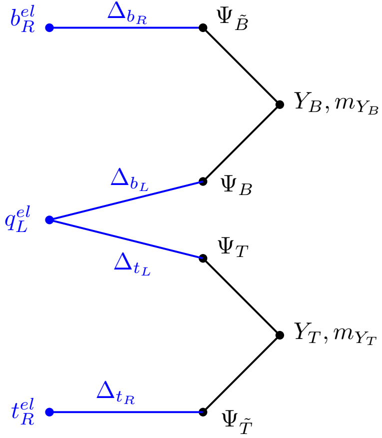
$\tan\theta = s_\theta / c_\theta = g_0 / g_*$
$\tan\psi = s_\psi / c_\psi = \sqrt{2} g_{0Y} / g_*$
$\xi = sin(\frac{v}{2f}) \simeq \frac{v}{2f}$
$v = \langle h \rangle = 246$ GeV

Model parameters (gauge):

$f \simeq 1$ TeV
and g_* perturbative ($\leq 4\pi$)
$M_* = f\ g_*$

4DCHM

Fermionic sector



Explicit breaking of $SO(5)$ through Yukawas in composite sector Y_T, Y_B

20 new fermionic resonances

- 10 in the top sector
- 10 in the bottom sector

Model parameters (fermion sector)

$$m_*$$
$$\Delta_{tL}, \Delta_{tR}, Y_T, m_{Y_T},$$
$$\Delta_{bL}, \Delta_{bR}, Y_B, m_{Y_B}$$

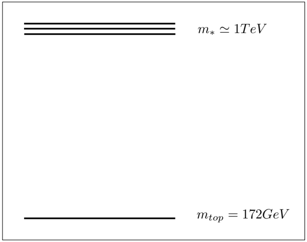
- Elementary(3^{rd}) fermions mix with composites via link fields Ω_1
- First two generation quarks and all leptons considered as in SM

4DCHM

Fermionic sector mass spectrum

Top and bottom sector ($\tilde{X} = X/m_*$)

Fermionic sector mass spectrum



$$m_b^2 \propto \xi \frac{m_*^2}{2} \tilde{\Delta}_{b_L}^2 \tilde{\Delta}_{b_R}^2 \tilde{Y}_B^2$$

$$m_t^2 \propto \xi \frac{m_*^2}{2} \tilde{\Delta}_{t_L}^2 \tilde{\Delta}_{t_R}^2 \tilde{Y}_T^2$$

$$m_{T_1}^2 \simeq \frac{m_*^2}{2} \left(2 + \tilde{M}_{Y_T}^2 - \tilde{M}_{Y_T} \sqrt{4 + \tilde{M}_{Y_T}^2} \right)$$

$$m_{B_1}^2 \simeq \frac{m_*^2}{2} \left(2 + \tilde{M}_{Y_B}^2 - \tilde{M}_{Y_B} \sqrt{4 + \tilde{M}_{Y_B}^2} \right)$$

Fermionic resonance mass $\simeq$1 TeV

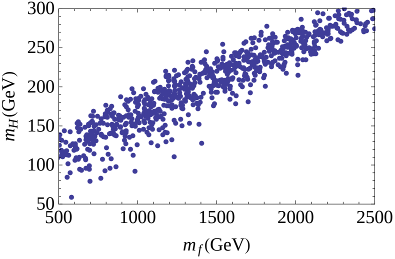
4DCHM

Recapping: Higgs sector at a glance

- Four PNGBs in the vector representation of $SO(4)$ one of which is composite Higgs boson
- Physical Higgs particle acquires mass through one-loop generated potential (Coleman-Weinberg)
- 4DCHM choice for fermionic sector gives finite potential, i.e., from location of minimum one extracts m_H and $\langle h \rangle$
- Partial compositness:
  1. SM gauge/fermion states couple to Higgs via mixing with composite particles
  2. 4DCHM gauge/fermion resonances couple to Higgs directly
- Zoo of new fermions and gauge bosons has potential to alter Higgs couplings via mixing and/or loops

4DCHM

- For natural choice of parameters, m_H consistent with 125 GeV



Masses of lightest fermionic partners f as a function of Higgs mass with 165 GeV $\leq m_t \leq$ 175 GeV, for (left) $f = 500$ GeV and (right) $f = 800$ GeV. Fermionic parameters are varied between 0.5 and 3 TeV. Gauge contribution corresponds to $M_{Z',W'} = 2.5$ TeV. (From De Curtis, Redi, Tesi (arXiv:1110.1613).)

Particle spectrum

The particle spectrum of the 4DCHM is

- SM leptons: e, μ, τ, and ν_e, ν_μ, ν_τ
- SM quarks; u, d, c, s, t, b
- SM gauge bosons: $\gamma, Z^0, W^\pm, g$
- 5 extra neutral gauge bosons: $Z'_{i=1,\dots,5}$
- 3 extra charged gauge bosons: $W'^\pm_{i=1,2,3}$
- 8 extra charged 2/3 fermions: $t'_{i=1,\dots,8}$
- 8 extra charged -1/3 fermions: $b'_{i=1,\dots,8}$
- 2 charged 5/3 fermions: $T'_{i=1,2}$
- 2 charged -4/3 fermions: $B'_{i=1,2}$
- Higgs boson

Calculation

- More than 3000 Feynman rules ! A non-automated approach would have been impossible
- Implementation of the 4DCHM in numerical tools:
  - LanHEP for automated generation of Feynman rules A.Semenov (arXiv:1005.1909)
  - CalcHEP for automated calculation of physical observables (cross sections, widths...) Belyaev, Christensen and Pukhov (arXiv:1207.6082)
- Uploaded onto HEPMDB: `http://hepmdb.soton.ac.uk/` under 4DCHM(HAA+HGG)

Experimental constraints

- Implemented outside LanHEP/CalcHEP tools:
  - α, M_Z and G_F
  - Top, bottom and Higgs masses (same for 4DCHM & SM)

$$165\ \mathrm{GeV} \leq m_t \leq 175\ \mathrm{GeV}$$

$$2\ \mathrm{GeV} \leq m_b \leq 6\ \mathrm{GeV}$$

$$124\ \mathrm{GeV} \leq m_H \leq 126\ \mathrm{GeV}$$

  - $Zb\bar{b}$ and $Zt\bar{t}$ couplings
- Standalone Mathematica program performs scans on model parameters
- Output can be read by LanHEP/CalcHEP to compute physical observables

LHC results

Define benchmarks

- 4DCHM parameter scans with f and g_* fixed to:
  (a) $f = 0.75$ TeV and $g^* = 2$
  (b) $f = 0.8$ TeV and $g^* = 2.5$
  (c) $f = 1$ TeV and $g^* = 2$
  (d) $f = 1$ TeV and $g^* = 2.5$
  (e) $f = 1.1$ TeV and $g^* = 1.8$
  (f) $f = 1.2$ TeV and $g^* = 1.8$
- All other parameters varied:
  0.5 TeV $\leq m_*, \Delta_{tL}, \Delta_{tR}, Y_T, M_{Y_T}, Y_B, M_{Y_B} \leq$ 5 TeV
  0.05 TeV $\leq \Delta_{bL}$, $\Delta_{bR} \leq$ 0.5 TeV
- Total number of random points for each (f, g_*): $\approx$ 15M.
- Survival rate of $\mathcal{O}(10^{-5})$, variations amongst (f, g_*)s $\leq 30\%$
- 4DCHM highly constrained, phenomenologically interesting

LHC results

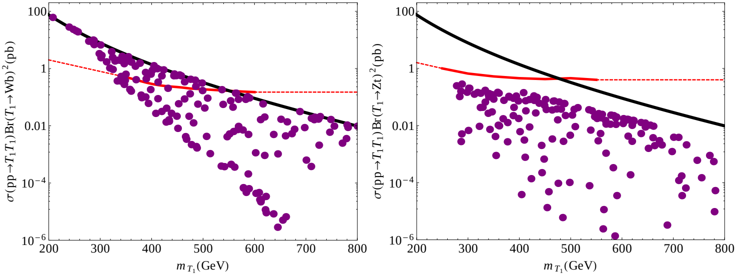
Limits on heavy gauge bosons and fermions

Call these Z', W', t' and b'

- Bosons:
  1. EWPTs (LEP, SLC & Tevatron) sets $M_{Z',W'} \geq 1.5$ TeV
  2. Z', W' have poor lepton rates, hence no stronger limits from direct searches (Tevatron & LHC)
- Fermions:
  1. Direct searches (LHC) more constraining, assume pair production (7 TeV)
  2. CMS with 5 fb^{-1}, BR$(t' \to W^+ b) = 100\%$
     CMS with 1.14 fb^{-1}, BR$(t' \to Zt) = 100\%$
  3. CMS with 4.9 fb^{-1}, BR$(b' \to W^- t) = 100\%$
     CMS with 4.9 fb^{-1}, BR$(b' \to Zb) = 100\%$
  4. Limit on T_1 and B_1 about 400 GeV, but it could be slightly lower

LHC results

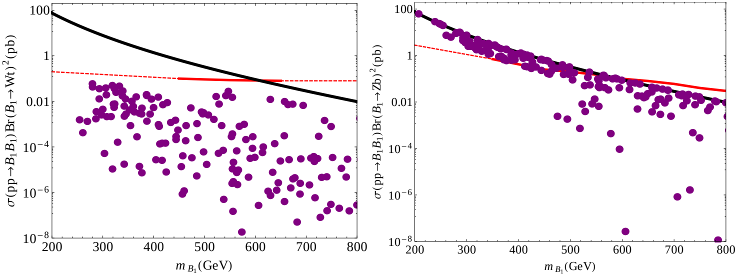
Limits on m_{T_1}



Black line is cross section assuming 100% BRs, red line is 95% CL observed limit and purple circles are 4DCHM points for $f = 1$ TeV and $g_* = 2$. Dotted-red line corresponds to extrapolations of experimental results.

LHC results

Limits on m_{B_1}



Black line is cross section assuming 100% BRs, red line is 95% CL observed limit and purple circles are 4DCHM points for $f = 1$ TeV and $g_* = 2$. Dotted-red line corresponds to extrapolations of experimental results.

LHC results

- Define R (μ) parameters, i.e., the observed events over SM:

$$R_{YY} = \frac{\sigma(pp \to HX)|_{\rm 4DCHM} \times {\rm BR}(H \to YY)|_{\rm 4DCHM}}{\sigma(pp \to HX)|_{\rm SM} \times {\rm BR}(H \to YY)|_{\rm SM}}$$

$YY = \gamma\gamma,\ b\bar{b},\ WW,\ ZZ$ (neglect $\tau^+\tau^-$)

- Relevant hadro-production processes:

$$gg \to H\,({\rm gluon-gluon\ fusion}) \quad q\bar{q}(') \to VH\,({\rm Higgs-strahlung})$$

$V = W, Z$

- Convenient to re-write (valid at LO and HO QCD)

$$R_{YY}^{Y'Y'} = \frac{\Gamma(H \to Y'Y')|_{\rm 4DCHM} \times \Gamma(H \to YY)|_{\rm 4DCHM}}{\Gamma(H \to Y'Y')|_{\rm SM} \times \Gamma(H \to YY)|_{\rm SM}} \frac{\Gamma_{\rm tot}(H)|_{\rm SM}}{\Gamma_{\rm tot}(H)|_{\rm 4DCHM}}$$

$Y'Y' = gg,\ VV$

LHC results

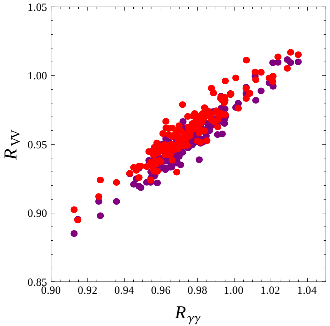
	ATLAS	CMS
$R_{\gamma\gamma}$	1.8 ± 0.4	$1.564^{+0.460}_{-0.419}$
R_{ZZ}	1.0 ± 0.4	$0.807^{+0.349}_{-0.280}$
R_{WW}	1.5 ± 0.6	$0.699^{+0.245}_{-0.232}$
R_{bb}	-0.4 ± 1.0	$1.075^{+0.593}_{-0.566}$

Summary of pre-Moriond LHC measurements of some R parameters from latest ATLAS (ATLAS-CONF-2012-170) and CMS (CMS-PAS-HIG-12-045) data.

- For $YY = \gamma\gamma, WW, ZZ$ take $Y'Y' = gg$ while for $YY = b\bar{b}$ take $Y'Y' = VV$
- Use $f = 1$ TeV and $g_* = 2$ for illustration, features generic to 4DCHM

LHC results

- Mixing effects only: $ZZ^* \to 4\ell$ and $WW^* \to 2\ell 2\nu_\ell$ (corrections to BRs different in 4DCHM)
- Both below 1 mostly, some points above, strong correlation suggests common cause for effect



Correlation between $R_{\gamma\gamma}$ and R_{VV}, $VV = WW$ (red) and ZZ (purple), for $f = 1$ TeV and $g_* = 2$. All points compliant with direct searches for t's and b's.

LHC results

- Introduce reduced couplings a la LHC HXSWG (A. Denner et al (arXiv:1209.0040))
- We can cast Rs in terms of κ's

$$R_{YY}^{Y'Y'} = \frac{\kappa_{Y'}^2 \kappa_Y^2}{\kappa_H^2}$$

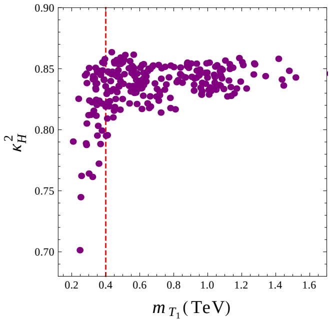
$$Y, Y' = b/\tau/g/\gamma/V$$

$$\kappa_{b/\tau/g/\gamma/V}^2 = \frac{\Gamma(H \to b\bar{b}/\tau^+\tau^-/gg/\gamma\gamma/VV)|_{\rm 4DCHM}}{\Gamma(H \to b\bar{b}/\tau^+\tau^-/gg/\gamma\gamma/VV)|_{\rm SM}}$$

$$\kappa_H^2 = \frac{\Gamma_{\rm tot}(H)|_{\rm 4DCHM}}{\Gamma_{\rm tot}(H)|_{\rm SM}}.$$

LHC results

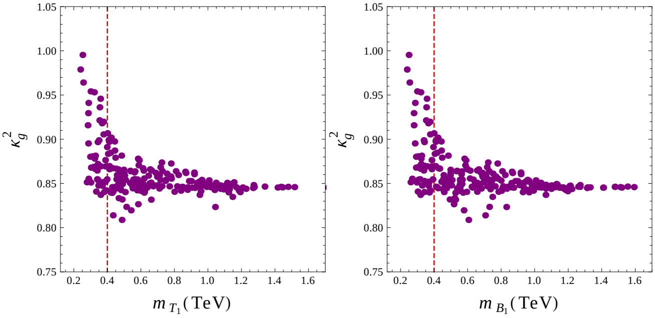
- κ_H smaller: $b - b'$ mixing, all Higgs rates rise



Distribution of κ_H versus (left) m_{T_1} and (right) m_{B_1} for $f = 1$ TeV and $g_* = 2$. Regions to left of vertical dashed-red lines excluded by t' and b' direct searches.

LHC results

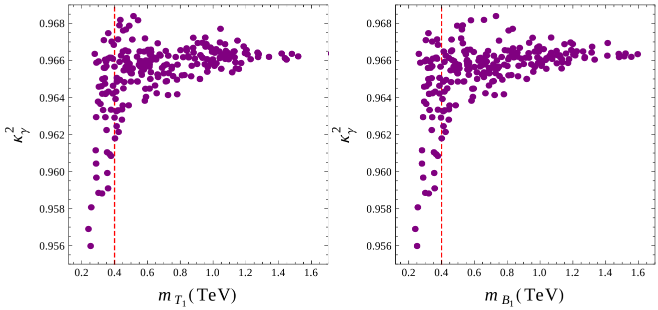
- κ_g smaller: $t - t'$ mixing, t-loop dominant
- Subtle cancellations/compensations



Distribution of κ_g versus (left) m_{T_1} and (right) m_{B_1} for $f = 1$ TeV and $g_* = 2$. Regions to left of vertical dashed-red lines excluded by t' and b' direct searches.

LHC results

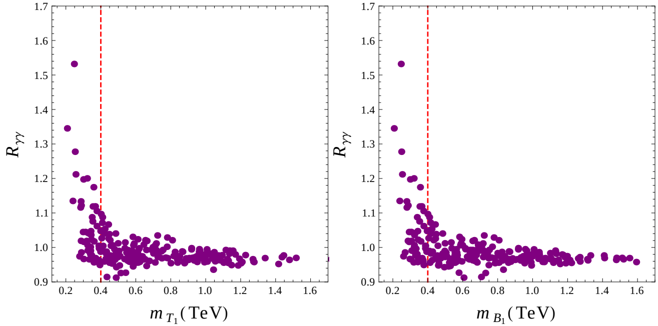
- κ_γ also smaller (less though): $t - t'$ mixing, t-loop subdominant
- Again, subtle cancellations/compensations



Distribution of κ_γ versus (left) m_{T_1} and (right) m_{B_1} for $f = 1$ TeV and $g_* = 2$. Regions to left of vertical dashed-red lines excluded by t' and b' direct searches.

LHC results

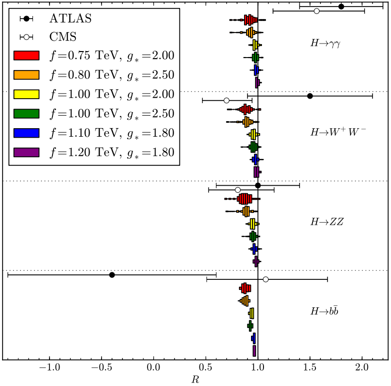
- T_1 and B_1 masses play significant role, revisit $R_{\gamma\gamma}$
- Leakage of points towars large $R_{\gamma\gamma} > 1$ at small masses
- Asymptotic result for $m_{T_1,B_1} \to \infty$ can be wrong by 10+%



Distributions of $R_{\gamma\gamma}$ versus (left) m_{T_1} and (right) m_{B_1} for $f = 1$ TeV and $g_* = 2$. Regions to left of vertical dashed-red lines excluded by t' and b' direct searches.

LHC results

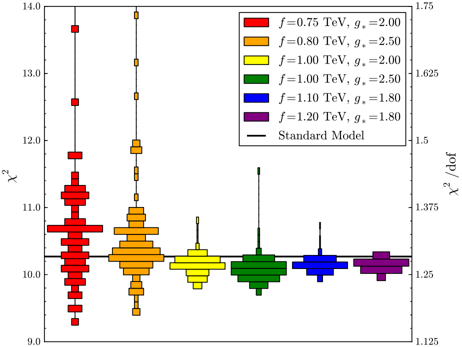
- Compare all benchmarks to SM & data



4DCHM against data for all (f, g_*) benchmarks. Points compliant with t' and b' direct searches.

LHC results

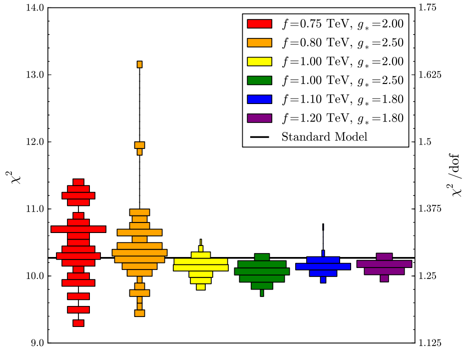
- Perform χ^2 fit and compare to SM, can be better



4DCHM χ^2 fits for all benchmarks in (f, g_*). Line is SM. Points compliant with t' and b' direct searches.

LHC results

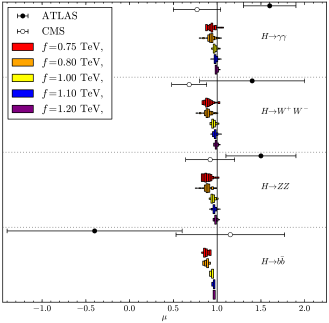
- Add $m_{\tilde{T}_1} > 600$ GeV (no limits on $m_{\tilde{B}_1}$)

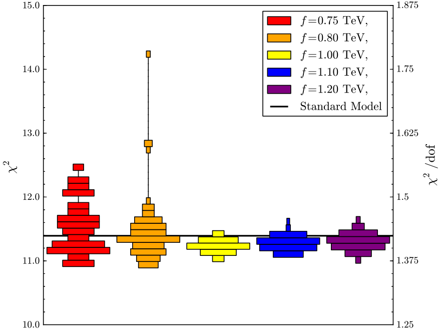


4DCHM χ^2 fits for all benchmarks in (f, g_*). Line is SM. Points compliant with t' and b' plus $\tilde{T}_1$ direct searches.

LHC results

- After Moriond updates



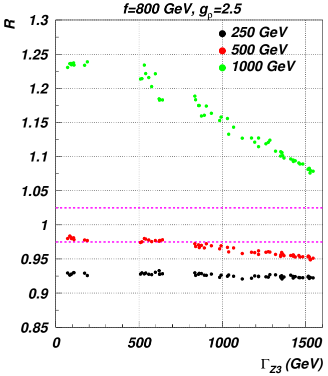


4DCHM against data (left) and χ^2 fits (right) for all benchmarks in (f, g_*). Line is SM. Points compliant with t' and b' plus $\tilde{T}_1$ direct searches.

LC results

Higgs-strahlung (ZH)

- Production cross section affected by Z's: define $R = \frac{\sigma_{\rm 4DCHM}}{\sigma_{\rm SM}}$
- Visible at higher LC energies, needs Z's to be wide



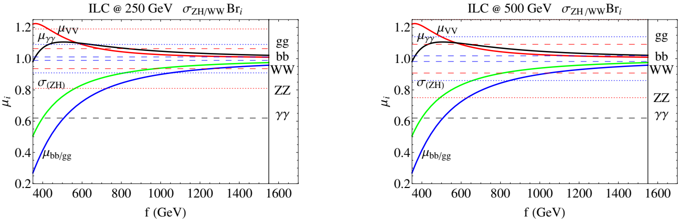
Corrections induced by mixing plus Z_3 exchange as a function of its width for benchmarks (b) (left) and (c) (right).

LC results

Higgs-strahlung times BRs

- Take low energies, 250 and 500 GeV, and look at leading $\zeta = v^2/f^2$ corrections
- Couplings rescale simply:

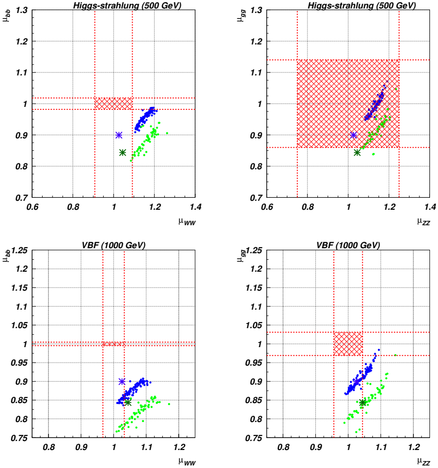
$$\frac{g_{HVV}^{\rm SM}}{g_{HVV}^{\rm 4DCHM}} = \sqrt{1-\zeta}, \quad \frac{g_{Hff}^{\rm SM}}{g_{Hff}^{\rm 4DCHM}} = \frac{1-2\zeta}{\sqrt{1-\zeta}}$$



WW, ZZ (red), $\gamma\gamma$ (black) and $b\bar{b}/gg$ (blue) signal strength as function of f. In green ratio of inclusive ZH cross sections. Horizontal for expected accuracies $\sigma\times$ BR for a 250 GeV and fb^{-1} (left) and 500 GeV and fb^{-1} (right) LC.

LC results

- Can disentangle model via couplings (use proper benchmarks)

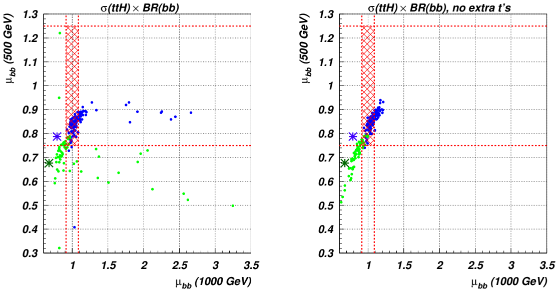


Correlations among Rs for HS (top) and VBF (bottom), with $f = 800$ GeV, $g_* = 2.5$ (green) and $f = 1000$ GeV, $g_* = 2$ (blue).

LC results

Top Yukawa coupling from $e^+e^- \to t\bar{t}H$

- Z's & t's in propagators other than mixing effects
- Optimistic, good experimental accuracy: 35%(9%) at a 500 GeV and fb^{-1}(1000 GeV and fb^{-1}) LC.

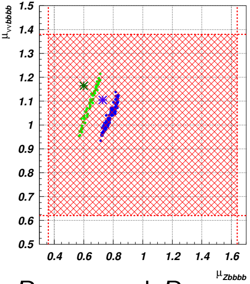


Correlations among R_{bb}s with the inclusion of t' quarks (left) and without these (right), with $f = 800$ GeV, $g_* = 2.5$ (green) and $f = 1000$ GeV, $g_* = 2$ (blue).

LC results

Higgs self-coupling from $Z(\to \ell^+\ell^-)HH(\to 4b)$ and $\nu\bar{\nu}HH(\to 4b)$

- Rescaling is $\lambda_{\mathrm{4DCHM}} = \lambda_{\mathrm{SM}} \frac{1-2\zeta}{\sqrt{1-\zeta}}$
- Difficult, poor experimental accuracy: 64%(38%) for $ZHH(\nu\bar{\nu}HH)$ at a 500 GeV and fb^{-1}(1000 GeV and fb^{-1}) LC.



Correlations among $R_{Zb\bar{b}b\bar{b}}$ and $R_{\nu_e\bar{\nu}_e b\bar{b}b\bar{b}}$ for two energy and luminosity stages, with $f = 800$ GeV, $g_* = 2.5$ (green) and $f = 1000$ GeV, $g_* = 2$ (blue).

Conclusions

- 4DCHM could provide explanation to LHC data pointing to Higgs discovery at 125–126 GeV (some better χ^2's than SM)
- Substantial parameter space scans show possible moderate enhancement in $H \to \gamma\gamma$, i.e., $R_{\gamma\gamma} \approx 1.1$
- $R_{\gamma\gamma}$ could grow to ≈ 1.3, if t' and b' masses just below results of our extrapolations
- 4DCHM main effect is reduction of Hbb (b-b' mixing), smaller $\Gamma_{\rm tot}(H)$
- Competing effects from Hgg also smaller, $H\gamma\gamma$ almost stable
- Relevant by-product: approximations assuming t' and b' masses infinite cannot be accurate
- Composite Higgs solution to LHC data seemingly possible and wanting light fermionic partners
- Revisit t', b' searches in 4DCHM dependent way (in progress)
- Future LC ideal to test modified $hb\bar{b}$, hW^+W^-, hZZ etc.
- LC can also probe altered top Yukawa and possibly λ
- LC sensitive to virtual t', Z' (W' less) in Higgs processes

Backup slides

- SM left doublet can be embedded in $(\mathbf{2},\mathbf{2})_{2/3} \in \Psi_T$ as,

$$\mathbf{5}_{2/3} = (\mathbf{2},\mathbf{2})_{2/3} \oplus (\mathbf{1},\mathbf{1})_{2/3}, \qquad (\mathbf{2},\mathbf{2})_{2/3} = \begin{pmatrix} T & T_{\frac{5}{3}} \\ B & T_{\frac{2}{3}} \end{pmatrix}$$

- t_R coupled to singlet in different $\mathbf{5}_{2/3}$ representation, $\Psi_{\widetilde{T}}$
- b_R coupled to singlet in a $\mathbf{5}_{-1/3}$ $(\Psi_{\widetilde{B}})$
- To generate b Yukawa it is necessary (by $U(1)_X$ symmetry) to couple SM doublet to second doublet in $\mathbf{5}_{-1/3}$ (Ψ_B) which contains

$$\mathbf{5}_{-1/3} = (\mathbf{2},\mathbf{2})_{-1/3} \oplus (\mathbf{1},\mathbf{1})_{-1/3}, \qquad (\mathbf{2},\mathbf{2})_{-1/3} = \begin{pmatrix} B_{-\frac{1}{3}} & T' \\ B_{-\frac{4}{3}} & B' \end{pmatrix}$$

Higgs interactions

In unitary gauge link fields $\Omega_n = \mathbf{1} + i\frac{s_n}{h}\Pi + \frac{c_n - 1}{h^2}\Pi^2$,

$$s_n = \sin(fh/f_n^2), \quad c_n = \cos(fh/f_n^2), \quad h = \sqrt{h^{\hat{a}}h^{\hat{a}}}, \quad \sum_{n=1}^{2}\frac{1}{f_n^2} = \frac{1}{f^2}$$

Identify $\Pi = \sqrt{2}h^{\hat{a}}T^{\hat{a}}$ GB matrix and $T^{\hat{a}}$'s $SO(5)/SO(4)$ broken generators ($\hat{a} = 1, 2, 3, 4$)

$$\Pi = \sqrt{2}h^{\hat{a}}T^{\hat{a}} = -i\begin{pmatrix} 0_4 & \mathbf{h} \\ -\mathbf{h}^T & 0 \end{pmatrix}, \quad \mathbf{h}^T = (h_1, h_2, h_3, h_4)\,.$$

Relate $\mathbf{h}$ to usual SM $SU(2)_L$ Higgs doublet

$$H = \frac{1}{\sqrt{2}}\begin{pmatrix} -ih_1 - h_2 \\ -ih_3 + h_4 \end{pmatrix}.$$

Backup slides

Use $\Omega_n = \mathbf{1} + \delta\Omega_n$ to define Higgs interactions

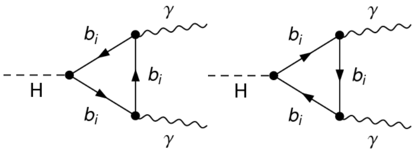
$$\begin{aligned}
\mathcal{L}_{gauge,H} =& -\frac{f_1^2}{2} g_0 g_* Tr\left[\tilde{W}\delta\Omega_1\tilde{A} + \tilde{W}\tilde{A}\delta\Omega_1^T + \tilde{W}\delta\Omega_1\tilde{A}\delta\Omega_1^T\right] \\
&+ \frac{f_2^2}{2} g_*^2 \left[\phi_0^T\delta\Omega_2^T\tilde{A}\tilde{A}\phi_0 + \phi_0^T\tilde{A}\tilde{A}\delta\Omega_2\phi_0 + \phi_0^T\delta\Omega_2^T\tilde{A}\tilde{A}\delta\Omega_2\phi_0\right], \\
\mathcal{L}_{ferm,H} =& \Delta_{t_L}\bar{q}_L^{el}\delta\Omega_1\Psi_T + \Delta_{t_R}\bar{t}_R^{el}\delta\Omega_1\Psi_{\tilde{T}} \\
&- Y_T\bar{\Psi}_{T,L}(\phi_0^T\phi_0\delta\Omega_2^T + \delta\Omega_2\phi_0\phi_0^T + \delta\Omega_2\phi_0^T\phi_0\delta\Omega_2^T)\Psi_{\tilde{T},R} \\
&+ (T \to B) + h.c.
\end{aligned}$$

- In unitary gauge $h_1,\ h_2,\ h_3$ eaten by $W^{\pm}, Z$ and h_4 is H
- Expand $\delta\Omega_{1,2}$ to first order in H to extract $g_{HV_iV_j}$ and $g_{Hf_i\bar{f}_j}$
- Couplings to mass eigenstates obtained after diagonalization

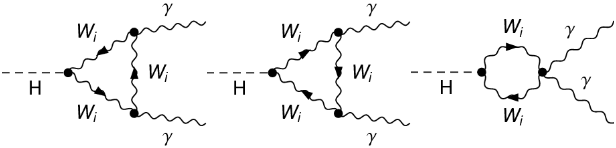
Backup slides

Subtle loop cancellations/compensations

- Consider loop diagrams



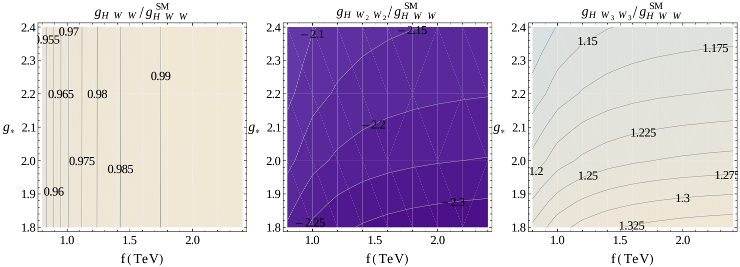
$H \to \gamma\gamma$ induced by fermionic loop



$H \to \gamma\gamma$ induced by a charged vector loop

Backup slides

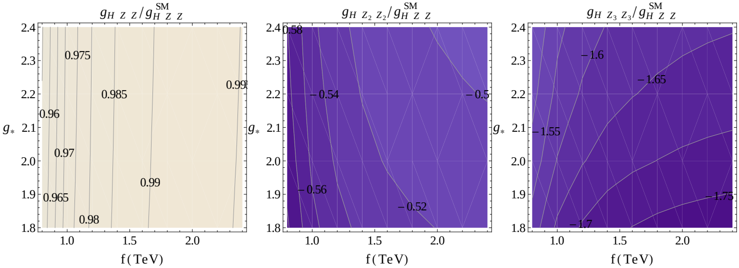
- Consider HV_iV_i charged couplings (SM-like and Extra)



Couplings of Higgs boson in 4DCHM to charged gauge bosons (W left, W_2 middle, W_3 right) normalised to SM values.

Backup slides

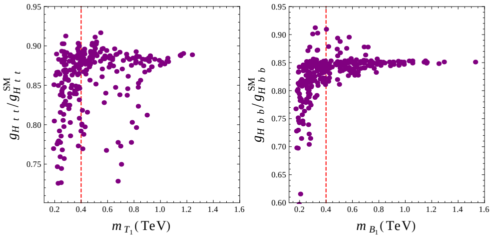
- Consider HV_iV_i neutral couplings (SM-like and Extra)



Couplings of Higgs boson in 4DCHM to neutral gauge bosons (Z left, Z_2 middle, Z_3 right) normalised to SM values.

Backup slides

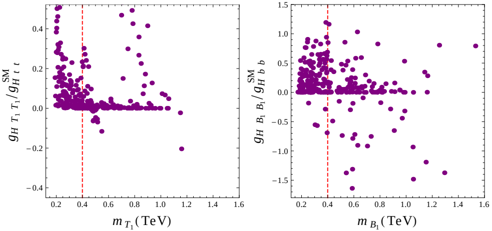
- Consider $Hf_i\bar{f}_i$ couplings (SM-like)



Couplings of Higgs boson in 4DCHM to top (left) and bottom (right) quarks normalised to SM values vs m_{T_1} and m_{B_1} for $f = 0.8$ TeV and $g_* = 2.5$.

Backup slides

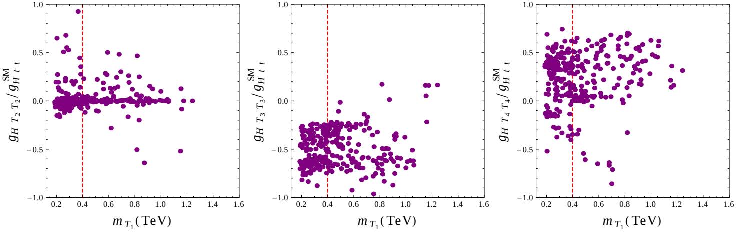
- Consider $Hf_i\bar{f}_i$ couplings (extra light)



Couplings of Higgs boson in 4DCHM to lightest heavy top (left) and bottom (right) quarks normalised to SM values vs m_{T_1} and m_{B_1} for $f = 0.8$ TeV and $g_* = 2.5$.

Backup slides

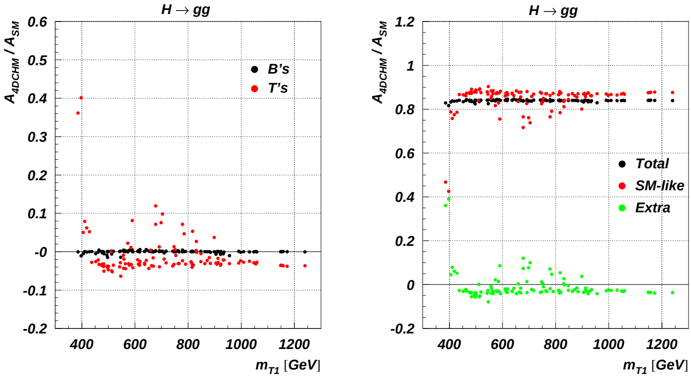
- Consider $Hf_i\bar{f}_i$ couplings (extra heavy)



Couplings of Higgs boson in 4DCHM to second (left), third (middle) and fourth (right) lightest heavy top quarks normalised to SM values vs m_{T_1} and m_{B_1} for $f = 0.8$ TeV and $g_* = 2.5$.

Backup slides

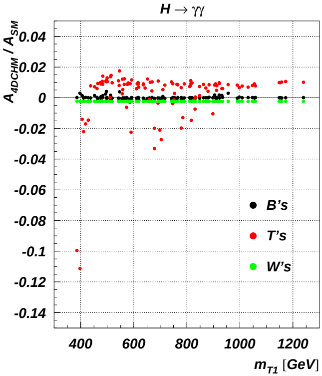
- Loop compensations between SM-like and Extra quarks (gg)

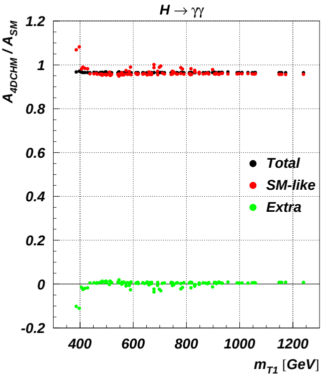


Loop contributions to $H \to gg$ in 4DCHM normalised to SM vs m_{T_1} for $f = 0.8$ TeV and $g_* = 2.5$.

Backup slides

- Loop compensations between SM-like and Extra quarks ($\gamma\gamma$)

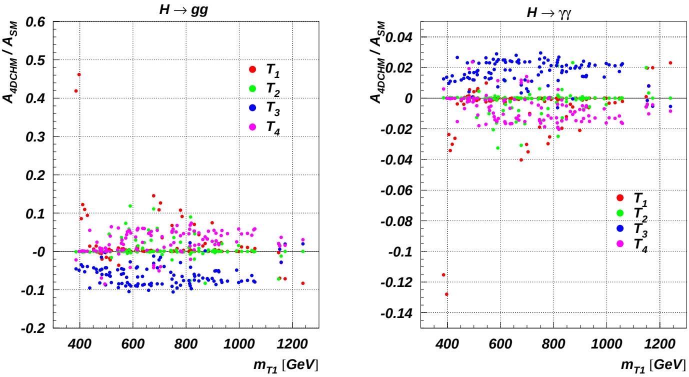




Loop contributions to $H \to \gamma\gamma$ in 4DCHM normalised to SM vs m_{T_1} for $f = 0.8$ TeV and $g_* = 2.5$.

Backup slides

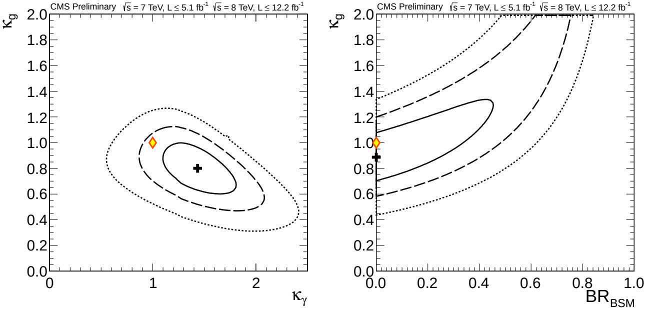
- Loop cancellations between Extra quarks



Loop contributions to $H \to gg$ (left) and $\gamma\gamma$ (right) in 4DCHM normalised to SM amplitude vs m_{T_1} for $f = 0.8$ TeV and $g_* = 2.5$.

Backup slides

- Outlook:
  1. ATLAS & CMS allow for $\kappa_H \geq 1$
  2. Need $\kappa_H < 1$ in 4DCHM (also useful for other BSMs, e.g., SUSY, 2HDMs - Higgs mixing)



CMS fits to κ_g and κ_γ for (left) $\kappa_H = 1$ and (right) $\kappa_H > 1$.
